

CURSO 2

MODULO 1

CURSO DE
SALIDA

Data Fundamentals

IBM SkillsBuild

This course is one of several in the Data Fundamentals series. Complete all of the courses in the Data Fundamentals learning plan and earn the **Data Fundamentals** digital credential from IBM!

For more information about this credential, visit [Data Fundamentals](#) on Credly.

DONE

a ciencia de datos es como buscar patrones y respuestas en un mar de información. Se trata de analizar grandes cantidades de datos para encontrar tendencias, hacer predicciones y tomar mejores decisiones.

Remaining characters: 296

MODULO 2

CRISP-DM stands for **Cross-Industry Standard Process for Data Mining**.

Founded by the [European Strategic Program on Research in Information Technology](#) initiative, CRISP-DM is a proven way to guide data mining efforts. Any industry can use this methodology to help structure a data science project. CRISP-DM is a flexible and comprehensive data science approach.

KDD stands for **Knowledge Discovery in Database**.

KDD represents the overall process of collecting data and methodically refining it. KDD typically has five steps:

1. Selection
2. Preprocessing
3. Transformation
4. Data Mining
5. Interpretation/Evaluation

MODULO 3

Every project, regardless of how big it is, starts with **business understanding**. Before any data exploration can be done, the team must understand the problem that needs to be solved.

The **business sponsor** plays a critical role. Business sponsors are in a leadership position. They initiate the project because they have a “pain point”, so they bring the business problem to the data science project team and then support the project.

Step 1: Business understanding

Data scientists identify and collect data from existing and often new sources in a business. This could be structured and unstructured data that is relevant to the problem. They might retrieve data from sources such as:

- Static files, such as spreadsheets
- Databases
- The internet

Step 2: Data exploration and preparation

Deploying a model is the step in which the machine learning model is integrated into a business' production environment. Data scientists perform this step using a company's chosen tool set and software. Once a model is saved and deployed, the model can be used to continue making **better predictions for future solutions**. The model operates according to a schedule, and it must be maintained by a data scientist.

Step 6: Deploy data models

MODULO 5

How do they work together?

Skilled data analysts, scientists, and engineers are transformative figures in modern business. They collaborate on data science projects to solve problems and speed up innovation. Here is a brief, high-level overview so you can learn how Joseph, Zhanna, and Ronnie interact and collaborate on a project.
